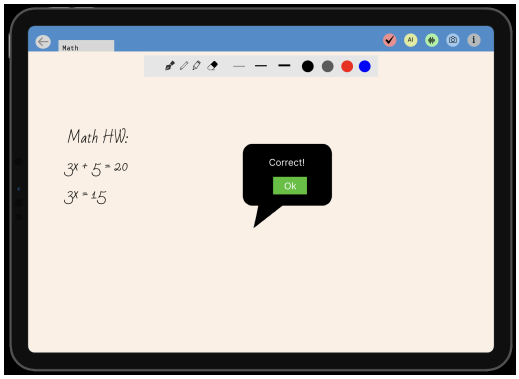
Design Evolution

Final Solution:

Our final solution is an IPad note taker app called ThoughAI. Most of our interviewees were students who viewed AI negatively because they used it as a shortcut and didn't learn from it. Thus we created a note taking app for students that uses AI to help with problems without directly giving them the answer.

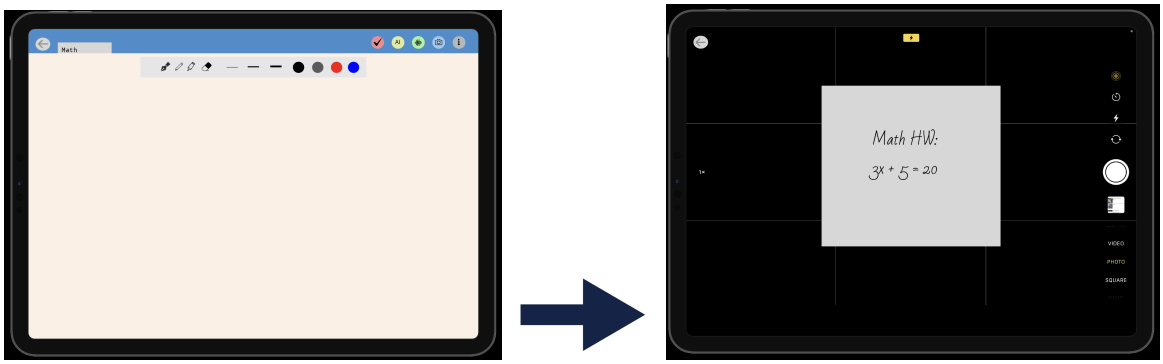
Tasks:

Simple task: Write down problem and your work and click the red checker button to check if your work is correct. This is important to user base because it allows students to check each step of the work that they came up with instead of using AI to generate the entire solution.

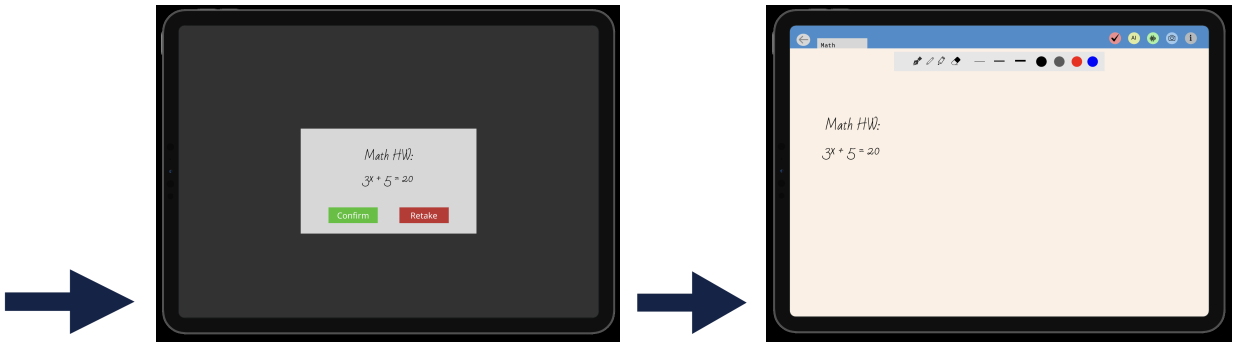


Checker checks that work is incorrect so it gives a hint	Checker checks that work is correct

Moderate task: Take a picture of problem, import it, then have the yellow AI button give hints to the next step. This is important to the user base because it allows students to get the next step or hints to help prompt their brain into solving the problem on their own instead of AI directly giving them answers.



Blank note page	Clicking blue camera button takes you to camera

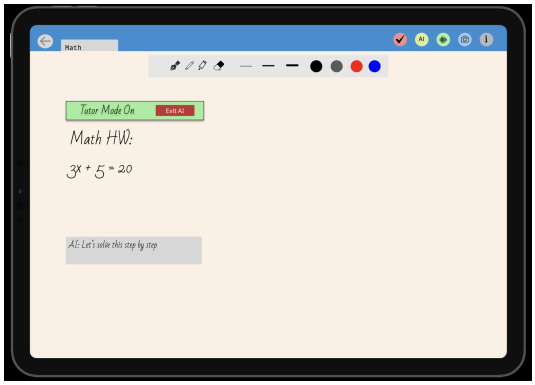


Confirm page to check if camera took photos properly, if retake is clicked, takes user back to camera page	Imports problem from picture taken

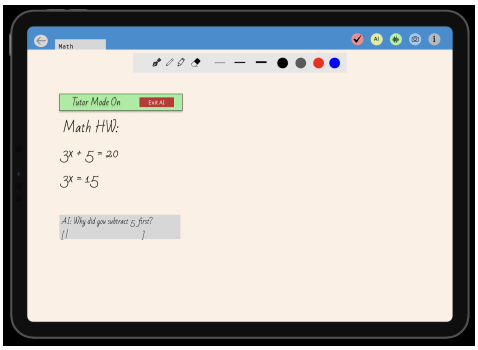
Click yellow AI button to give hint to problem

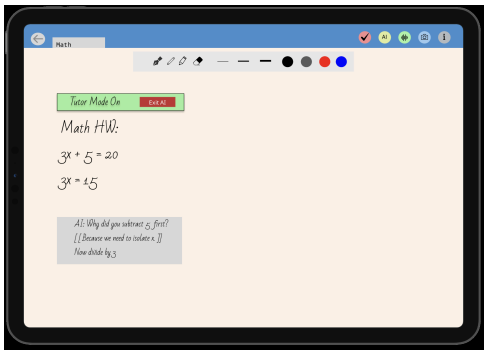
Complex task: Click the green voice button at any step of the problem to go into AI voice guide that talks students through each step. Exit the AI tutor at any time by hitting exit AI button. This

is important for our user base because some students like to talk through their thought process instead of reading it.

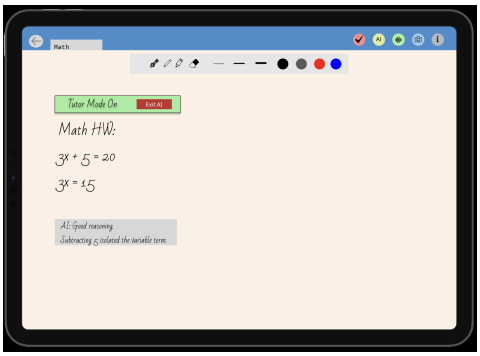


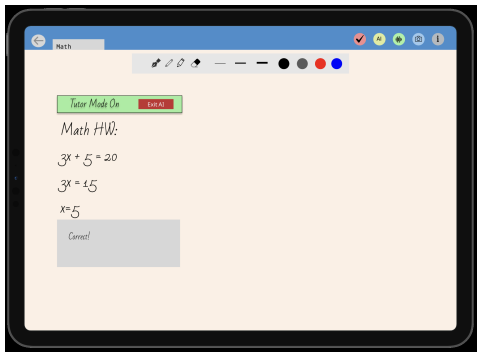
Problem is already in the notes	Click green voice button to activate AI tutor



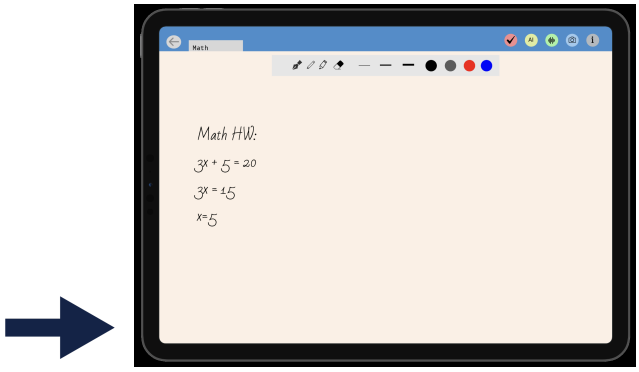


Ai tutor walks students through their own rational	Student answers verbally, but is mimicked here through text





AI provides motivation for students in their reasoning	Student writes the next steps and AI validates



AI tutor mode is exited
